

Full Throttle

Diploid Perennial Ryegrass

Product Sheet

Characteristics:

Full Throttle, diploid perennial ryegrass, is an advanced generation, synthetic cultivar resulting from three selections in open pollinated lines from collections made in Australia and North America. It is a unique variety that has strong drought and cold tolerance, while retaining a moderately-active habit and high protein content. Full Throttle is an early to medium maturing plant with a low, dense-crowned, fine-leaved variety that is moderately resistant to stem rust. It has strong seedling vigor, a persistent crown and is endophyte free.

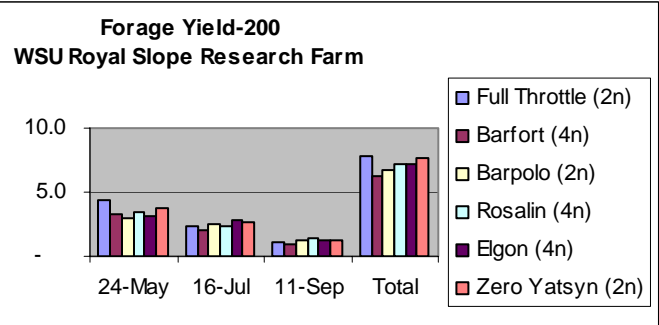

An elite forage-producing variety with significant improvements on “expanded seasonal forage production” for a lengthened growing season.
